

Emission Line
Classification of BAL
and Non-BAL Quasars

Review of Quasars and BAL Quasars

Motivations Behind Research

Research Process for non-BAL and BAL Quasars

Results for non-BAL and BAL Quasars

Conclusion

What is a Quasar?

- Highly luminous galactic core that radiates across the electromagnetic spectrum
- Incredibly distant : 10 million light years to billions of light years away
- Caused by friction between inflowing gases in the accretion disk

Quasar Spectrum

What is a BALQ?

- Stands for Broad Absorption Line Quasar
- Shows dips in luminosity across a broad range of wavelengths
- Caused by absorption from absorption "clouds" far from the accretion disk

BAL Spectrum

Motivations Behind Research

- NSF Proposal:
 - Funds SIMBAL work
 - Requires BAL spectra to be analyzed and non-BAL comparison sample
- 4MOST
 - New European survey facility added to the VISTA telescope
 - Used by SIMBAL to get better data on BALQs
 - BAL spectra need to be analyzed

Research Process: Clusters

- K-Means Clustering program groups quasars into three clusters
- The quasars in each group have similar emission line properties
- Each cluster has a mean spectral shape
- Not all spectra look like the mean spectrum

Research Process: Eigenvectors

- Generated using Principal Component Analysis (PCA)
- Set of basis vectors used to alter mean spectra to account for variations in shape
- Each cluster has a set of four eigenvectors
- Coefficients are recalculated after every fit

Research Process:
Analyzing a BAL Quasar
Spectrum

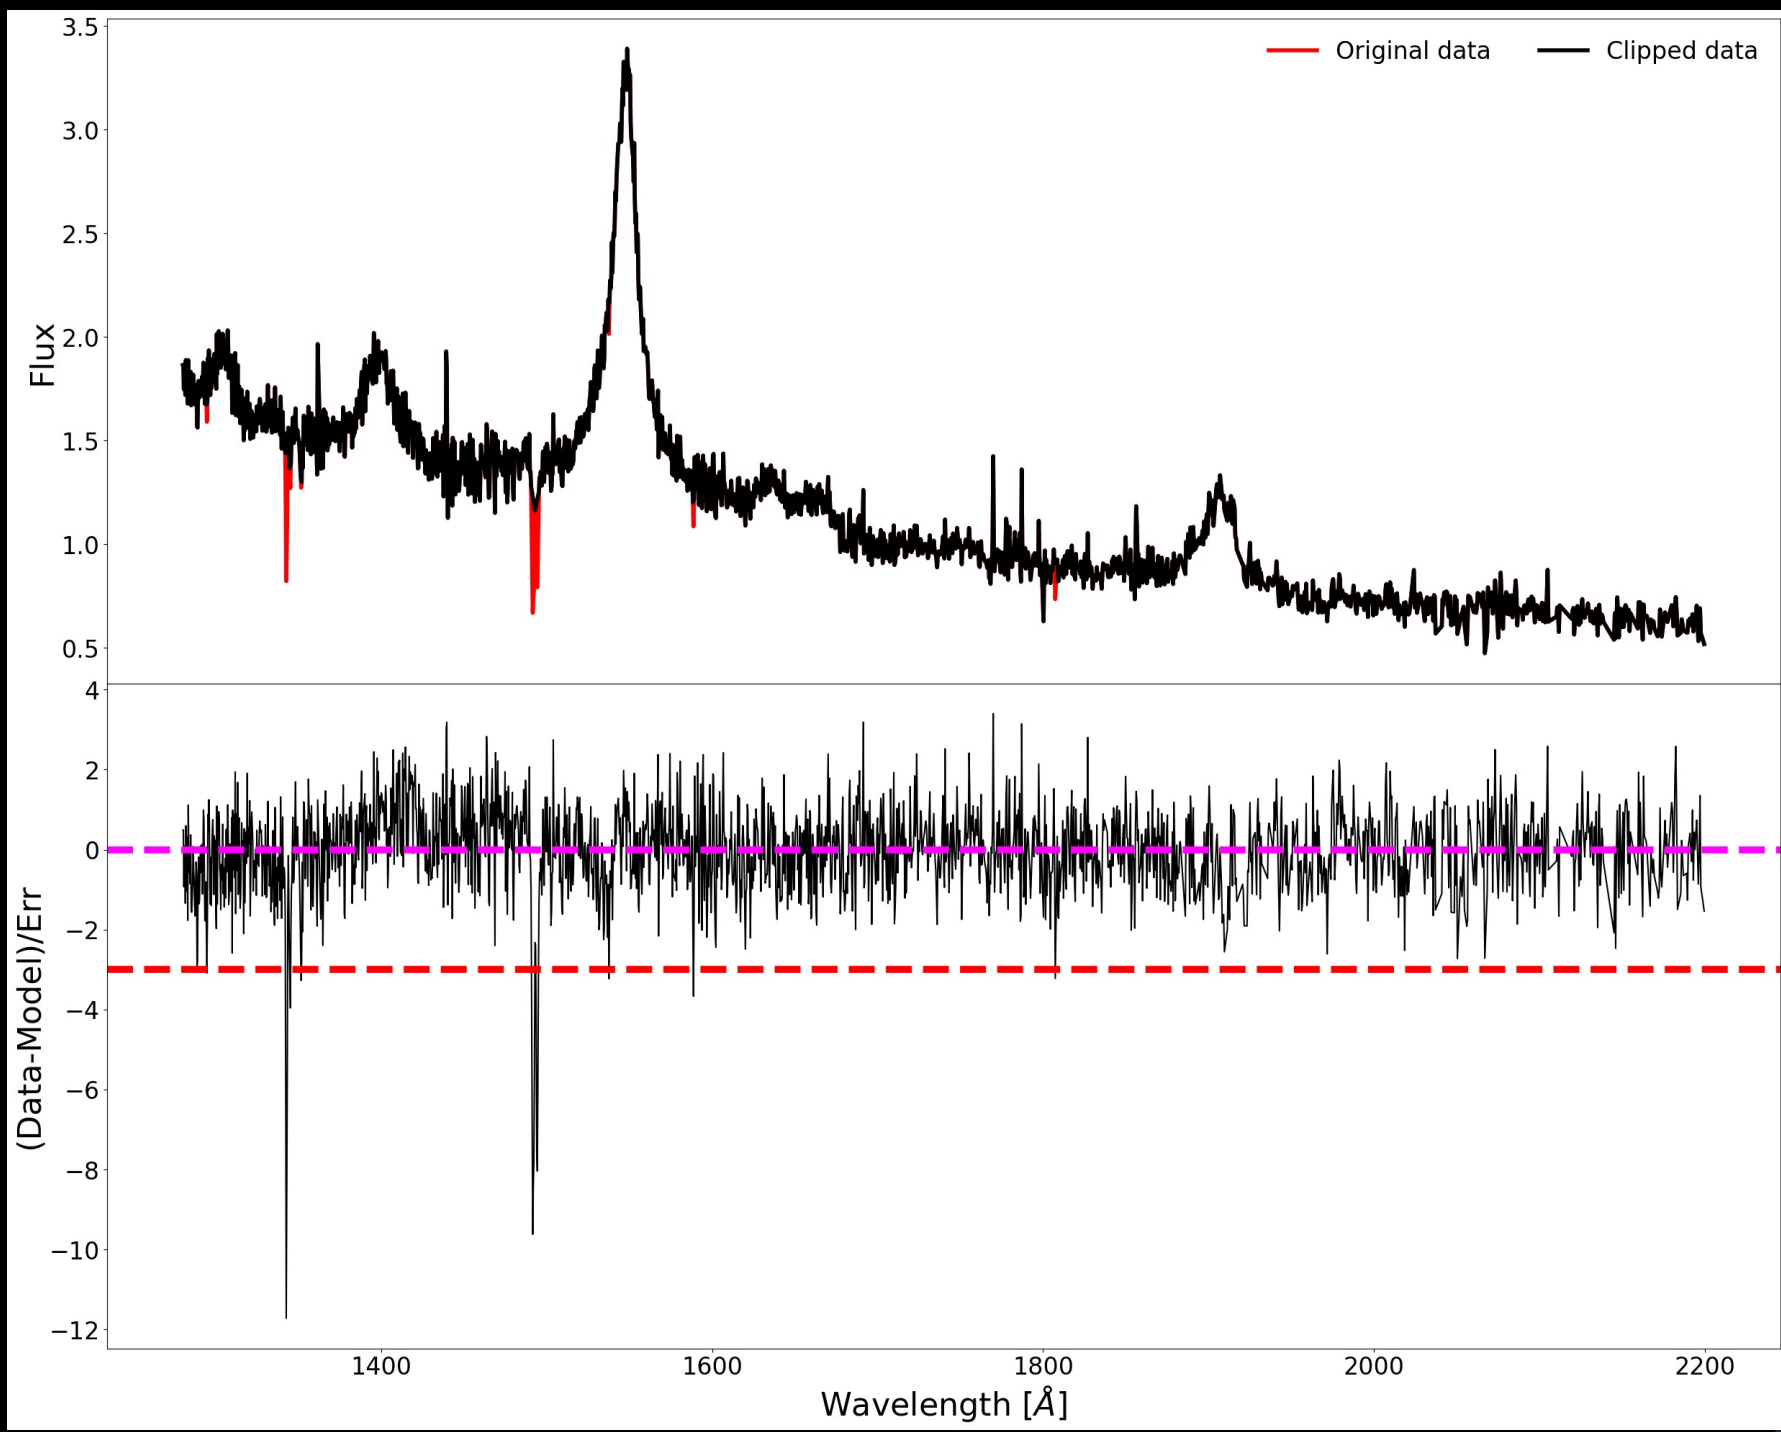

Research Process:
Cleaning Non-BAL
Quasar Spectra

Results from Model Fitting:
Successful non-BAL Model
Fits

Results from Model Fitting:
Successful BAL Model Fits

A collection of colorful wooden blocks, including purple, blue, orange, green, red, pink, yellow, and brown, scattered on a wooden surface. A central black text box contains the following text:

Results from Model
Fitting: Difficult
BAL Model Fit

Conclusion

- Research into BAL quasars will help broaden our understanding of galactic evolution
- My goals are to fit and characterize all BAL and non-BAL spectra in our data set
- Work for the near future:
 - Automate spectra-analyzing program
 - Automate “clipping” without cutting into “good” data points
 - Constrain requirements for the best fitting model
