June 13, 2024

# **ELECTRONIC BAND STRUCTURE**

- In quantum mechanics, eigenvalues and eigenstates fully<sub>3</sub> describe the physical behavior of a system.
- $4p4 \blacktriangleright$  Historically, the eigenvalues are primarily emphasized.
  - These include energy, momentum, spin, etc. all observable quantities!
  - In solids, electronic band structure describes the allowed range of energy levels that electrons may occupy.

# QUANTUM GEOMETRIC TENSOR

**OUANTUM GEOMETRIC TENSOR** 

However, there is also a rich quantum geometry of the (projective) Hilbert space itself.

• Admits definition of distances between quantum states.

BERRY PHASE

The geometry of the Hilbert space is captured in the quantum geometric tensor:

$$T_{ij}\left(u_{\lambda}\right) \equiv \left\langle \partial_{i}u_{\lambda} \mid \left(1 - \left|u_{\lambda}\right\rangle \left\langle u_{\lambda}\right|\right) \mid \partial_{j}u_{\lambda}\right\rangle$$

(where  $\partial_i = \partial/\partial(k_i)$  with i = x, y and  $u_\lambda$  is a wave function parametrized by some quantity  $\lambda$ ).

#### BERRY PHASE

The complex **phase** of a quantum state is usually thought of as having no physical significance. However, the **relative phase** between states can have crucial physical consequences. The

Berry phase describes how a (global) phase accumulates as a complex vector is carries about a closed loop in a complex vector space:

$$\left\langle \psi_{initial} \mid \psi_{final} \right\rangle = \exp\left(i\phi\right)$$

(in a "parallel-transport gauge").

### BERRY PHASE

#### In the continuum limit, the Berry phase can be expressed as:

$$\phi = \oint \langle u_{\lambda} \mid i \partial_{\lambda} u_{\lambda} \rangle \mathrm{d}\lambda = \oint A(\lambda) \mathrm{d}\lambda$$

The integrand is called the Berry connection:

$$A(\lambda) = \left\langle u_{\lambda} \mid i \partial_{\lambda} u_{\lambda} \right\rangle$$

◆□▶ ◆□▶ ◆豆▶ ◆豆▶ → 豆 → ��や

BERRY CURVATURE

The Berry curvature is simply the Berry phase per unit area in parameter space.

BERRY CURVATURE

$$\Phi_S = \int_S \Omega(\lambda) \mathrm{d}S = \oint_P A \cdot \mathrm{d}\lambda = \phi_P$$

The imaginary part of  $T_{ij}$  is a (real) antisymmetric second-rank tensor; this is exactly half the Berry curvature:

$$T_{ij} \equiv g_{ij} + \frac{i}{2}\Omega_{ij}$$

◆ロト ◆舂 ト ◆臣 ト ◆臣 ト ○臣 - のへで

# QUANTUM METRIC

The real part of the quantum metric tensor  $T_{ij}$  is called the quantum metric.

$$T_{ij} \equiv g_{ij} + \frac{i}{2}\Omega_{ij}$$

 I'm interested in material properties which are affected by the quantum metric.
